Target version:			
Description			
Power Up/ Test Rest of scoutfly, while waiting for power boards to come back. From KWoo's email:			
You can probably power everything up. You will have to jury rig a reset line to the AVR but otherwise you should be able to test out the boards. You need to bypass the power path chip and always assert the enable line on the regulator. Other than that you will get out 5V and 3.3V. That should allow you to power everything else on the board, assuming that it works (I [KWoo] didn't test that part).
